In-line Filters
Kadant in-line filters can be provided in either a single or duplex arrangement. A single in-line filter is normally used in applications where the flow can be interrupted, or the filter can be bypassed when the filter element is serviced. Duo filters are typically used when continuous filtration is required. They can be operated with either one or two filter housings on-line. The inlet and outlet orientation allows both the single and duo in-line filters to be easily, quickly, and cost-effectively installed in a pipe run.

¹ NPT connection is standard. Socket weld and lap joint flange connections are available.
² Flow is based on the inlet and outlet connection size. Actual flow will be dependent upon the type of filter media used and influent contaminant loading.
³ Use of Tri-Screen filter elements will increase filtration area from 408 in² to 565 in² per barrel. Tri-Screen filter elements have a maximum hydraulic capacity of 120 gpm.

Overview

**Features**
- 1/4-turn safety cap
- Baffled flow design
- Pressure relief safety cap
- Filter element centering pin
- Positive seal o-rings
- Inlet and outlet gauge ports

**Benefits**
- Low maintenance
- Easy access to filter media
- Low cost installations
- Wide variety of filter media for most applications
The ErGo filtration system is an automatic backwashing system that can be used to remove contaminants from a variety of applications including process water and fresh water. End results include the protection of shower nozzles, process equipment, or contaminant removal improving product quality. The “bottomless” barrel design provides easy element removal and easy clean out. The ergonomically engineered system allows easy and safe access when changing filter elements.

**Overview**

**Features**
- 30° filter barrel mounting
- Bottomless filter barrel design
- Backwash uses filtered process water
- Reusable, cleanable filter media
- ¼-turn safety cap with pressure relief

**Benefits**
- Ergonomic design improves element removal safety
- Installation in low clearance areas
- Bottomless filter barrel allows easy clean-out
- Bottom “push-out” screen removal eases maintenance
- Pressure relief cap provides operator safety

**Applications**
- Fresh water
- Recycling of process water
- Dyes and additives
- Mechanical seal protection
- Chemicals
MegaFlo™ Backwash System

Internal backwash systems
Flow enters through the bottom inlet header and is distributed equally through each filter barrel. As contaminants build on the exterior filter screen, the differential pressure increases and backflushing is typically initiated at 12 to 15 psid. During backflush, one filter barrel is removed from service at a time by closing the inlet and opening the drain valve. Clean filtrate flows from the outlet header through the filter barrel to the drain. Each barrel is backwashed for 4 to 8 seconds. After all barrels have been backwashed, the system differential returns to 1 to 7 psid.

**Internal Backwash Considerations**
- 40 psig minimum inlet pressure required
- Clean system pressure loss is typically 1 to 7 psid, backflushing is initiated at 12 psid differential
- Outlet flow will decrease 50 to 150 gpm for 4 to 8 seconds per barrel
- Backwash flow 100 to 150 gpm per barrel

External backwash systems
The system operates identically to the internal backwash system in the filtration mode. An additional header is added at the top of the unit to introduce a secondary source of clean backflush fluid. When the differential pressure reaches 10 to 20 psid, the filter system must be backwashed. The inlet and outlet valves are closed and the drain and backwash supply header valves are opened. The outside source of clean liquid flushes the contaminants to drain. Each barrel is backwashed sequentially for 4 to 8 seconds and the system returns to the clean 1 to 7 psid.

**External Backwash Considerations**
- No minimum inlet pressure required for backflush
- Virtually no outlet flow fluctuations during backwash
- For backwash, a clean fluid is required at 60 psig or greater
- Normally used where the process liquid is expensive or viscous

*Use of Tri-Screen filter elements will increase filtration area from 408 in² to 565 in² per barrel.

Tri-Screen filter elements have a maximum hydraulic capacity of 120 gpm.
Kadant provides basket assemblies with rugged, reusable filter elements that can be removed and replaced in minutes to minimize the time a filter housing is out of service.

**Diffusion Bonded** filter elements are highly efficient, extremely durable wire mesh screens that can withstand many high-pressure washes without the need for replacement. They are manufactured with multiple layers of 316 stainless steel wire mesh that are supported by a perforated element. All layers are sintered at above 2000°F (1095°C) in a controlled atmosphere to allow the molecules to migrate (diffuse) across the contact points and recrystallize. This forms a strong, integrated structure where all contact points of the structures are bonded together.

**Wire Mesh** filter screens are wrapped tightly around and welded to a perforated stainless steel backer screen. For 150 mesh and finer filter elements, a coarse mesh drainage layer is placed between the fine mesh and the perforated backer screen for structural support, to disperse the flow and assure full utilization of the screen surface, and to eliminate the dead spots that would otherwise be created.

**Synthetic Fabric** filter screens are available in different materials that include nylon and polyester. As with the wire mesh, a coarse mesh drainage layer is attached to the perforated backer. The filter cloth is a sewn tube and the ends are tucked inside the bottom and top of the perforated element. The gasketed basket handle and basket bottom firmly clamp the fabric in place preventing bypass of contaminants.

**Spiral Wound Slotted Wedge Wire** is an extremely rugged filter media capable of withstanding very high differential pressures. It is especially suited for filtering fibers or gelatinous particles that have a tendency to "staple" themselves into the openings of the filter screens, making manual cleaning difficult.

**Perforated Stainless Steel** can be used as filter media alone for the removal of coarse particles, or as the support structure for wire mesh or synthetic type filter elements. The rolled steel straight seam design provides an element with exceptional crush resistance and more open area compared with tubes made using spiral wrap construction.

RotoFlex™ Resource Recovery Strainer

How It Works
The fluid to be filtered is supplied to a distribution header that feeds six stationary distribution header arms mounted on an angle parallel to the screen. A series of uniquely designed slots on each header delivers the feed at low pressure (less than 6 psig/1.4 bar) uniformly around the screen surface area. The impact force from the distribution slots combined with the precisely angled flow results in rotation of the screen assembly. Water that passes through the filtration medium collects and drains from the bottom of the unit. The retained solid material slides down the angled screen to the center where it exits the system to a user supplied collection tank.

Patented Filter Media Cleaning
The RotoFlex resource recovery strainer uses a unique method of filter media cleaning to keep the filter medium open and to flush contaminants from the surface. The conical media hangs freely from the upper support ring and is not attached or in contact with any part of the strainer below the ring. As the feed flow from the distribution headers impact the media and the media rotates, the synthetic mesh flexes back and forth, shedding the fiber and debris without the aid of a cleaning shower or scraping device. The feed flow helps wash the material to the center collection chamber for reuse or disposal.

RotoFlex Filter Media Life
Traditional backwashing filters and strainers use a secondary backer screen to support the primary filter media used for solids removal. Drawbacks include both reduced capacity and filter media wear at the point of contact between the two layers. The RotoFlex filter media free-hanging backerless design eliminates both issues, maximizing throughput and media life. In addition, debris sheds from the filter media without the need of a shower or water backflush. Energy applied to the media during the cleaning process is often a contributor to filter media wear. Elimination of the continuous shower will improve the media life and minimize the filter media change-out frequency.

Capacity
The maximum flow capacity of the RotoFlex resource recovery strainer is approximately 1500 gpm (5678 lpm). However, the maximum flow achieved for a given application will be dependent on the filter media, nature of solids removed (fiber freeness), and the total amount of suspended solids in the feed water.

Overview

Features
- Backerless filter media design
- Automatic upset recovery
- No external power for screen rotation
- Patented filter media cleaning system
- Optional intermittent cleaning shower
- Replace filter media in minutes

Benefits
- Recovery of water, heat, chemical, and fiber
- No electrical motors or continuous shower water required
- Continuous operation through system upset conditions
- High volume capacity

Applications
- DAF filtrate
- Clearleg save-all water
- Overflow cylinder vat water
- Vacuum pump seal water
- Felt hair removal from press section
- Fiber recovery from u-drains
Gravity Strainer

Model 4000 Series
Water to be filtered is piped into and channeled around the periphery of the tank. It flows upward and over a weir assembly for even distribution over a fine screen (75 to 355 micron or 40 to 200 mesh). The water is filtered leaving fibers and solids on the screen. Clean water is collected in the strainer’s bottom and flows from the unit. A continually rotating shower above the screen washes the rejects toward the center opening and the reject pipe for discharge. They are especially effective separating difficult fibrous material from process water streams.

* Capacity can vary depending on inlet loading and screen mesh.
** Height of support legs can vary to suit application.
*** Shower water is usually accept water from the gravity strainer supplied at 25 to 40 psig.

These figures are given only for information. For application specific details and recommendations, contact Kadant.

Overview

Features
- High flow rates with relatively high solids loading
- Gravity feed capability can eliminate pumps
- Continuous media cleaning with rotating showers
- Rotating shower is only moving part
- Corrosion-free fiberglass or stainless steel construction

Benefits
- Lower cost per gallon processed
- Minimal power cost and low maintenance
- Maximum throughput, minimal downtime, high efficiency
- No fresh water requirements
- BTU savings by reuse of warm process water
Para-Flow™ Parabolic Screen

Solids Separation System
The patented parabolic screening surface provides a change in the angular momentum and varying slot opening for maximum capacity and highest operating efficiency. The slot opening is the smallest where the fluid is most dilute and the change in angular momentum is greatest. Flow capacity up to 300 gpm (1,135 lpm) per screen and loadings up to 2.5% inlet consistency.

Overview

Features
- Single, double, or triple screen designs
- FRP housing and 316 stainless steel slotted media
- Optional oscillating showers
- Wide variety of slotted media available

Benefits
- Maximize recovery of expensive fiber
- High operating efficiency at a low cost/gpm
- Minimal maintenance and space requirement
- Initial stage of filtration to "scalp" large contaminants

Applications
- Solids separation
- Thickening
- Process water recycling
- Fiber scalping

The Petax filtration system delivers the benefits of water recycling without compromising process performance.

**How does the Petax filtration system work?**

- Vessel is full of process water and operates at low-pressure less than 2.5 psig (0.1 to 0.3 bar)
- Disks are completely submerged and slowly rotate
- Rotation speed increases to maintain low vessel pressure controlled by transducer monitoring pressure
- Clean filtrate passes through the media to central hollow shaft
- Disks are continuously cleaned in three stages
  1. Filter cake is doctored off and pumped away (if necessary)
  2. Clean filtrate is pulled back through media removing debris
  3. Oscillating high-pressure, submerged shower cleans the media

**Features**

- Patented filtering technology
- Three-stage media cleaning system
- Unique engineered filter medium
- Filtrate quality less than 20 ppm
- Particle removal less than 20 micron in size
- No chemicals or flocculants required

**Benefits**

- Reduce water and treatment costs
- Heat savings
- Fiber savings
- Reduce municipal treatment plant charges (less fiber and water sent to clarifier)
- Chemical savings
- Eliminate plugged nozzles and improve machine cleanliness
- Less contaminant in water circuits provides opportunity to recycle

**Overview**

Petax 0.010 wedge wire 100 mesh

**Take-off device**

**Doctoring cake (1)**

**Backwash media (2)**

**Oscillating HP shower (3)**

**Backflush liquid**

**5 to 25 rpm**
V-Force™ System

Solids separation system
Exclusive internal acceleration creates maximum performance to achieve maximum protection of fluid handling systems from unwanted solids. Its advanced and patented design, building upon the performance Kadant is known for, now also removes 50% more of the finer solids (less than 40 microns), resulting in higher aggregate solids removal. Independently tested. Proven superior for today’s demanding filtration requirements. For settleable solids with specific gravity of 1.7 or greater.

Overview

Features
- No moving parts to wear out
- No screen or filter element to clean or replace
- No backwashing water loss
- Low, steady pressure loss
- Continuous, uninterrupted operation

Benefits
- Low maintenance
- Low operating costs
- Easily handles upsets
- High flow solids separation
- Minimal purge volume
- Quick return on investment

Applications
- Removal of sand from rivers and lakes
- Cooling towers
- Pump protection
- Steel mill water recycling
- Spray nozzle protection
