Disassembly and Repair of Type 6000 Series IC™ Rotary Joints with ISSS™ Syphons

Follow your company’s safety procedures whenever working on Kadant Johnson products. Read all of the instructions before proceeding with the installation or repair.

Please refer to the Kadant Johnson assembly drawings for part identification. Assembly drawings are available on request from Kadant Johnson.

Lubricate all fasteners with anti-seize compound. Tighten all fasteners in a star pattern. Torque specifications are listed on the product assembly drawing and are available from Kadant Johnson.

NOTE: Do not use anti-seize or petroleum-based products on O-rings. Only lubricate the O-rings with the silicone lubricant supplied with the Kadant Johnson repair kit. Prior to handling lubricants, consult MSDS information.

REMOVAL:

STEP 1
Release residual pressure in the system. Close the inlet and outlet valve. Allow the rotary joint to cool sufficiently and then disconnect the inlet and outlet piping from the rotary joint.

STEP 2
Loosen and remove head bolts (2A) Remove head (2). Remove gasket (8) and clean gasket surfaces.

STEP 3
Mark the end of the horizontal pipe (99) where it passes through the pressure plate (43) or measure and record the distance from the pressure plate to the end of the horizontal pipe. See Figure 1. Mark the top center of the horizontal pipe. The horizontal pipe must be reinstalled in its original position to maintain syphon clearances inside the dryer.

STEP 4
Remove pressure plate retaining bolts and washers (44 and 45) and remove pressure plate (43).

STEP 5
Remove split rings (42) by pulling the horizontal pipe (99). In some cases a horizontal pipe handling tool will need to be inserted into the center of the horizontal pipe. See drawing B5733 for 1” pipe and B5734 for 1 1/4” pipe. Insert the tool and tighten the nut on the all-thread rod. Once installed the pipe can be moved as required. If necessary, the “U” bracket can be installed over the all-thread rod and used as a puller if the split rings are stuck.

STEP 6
Loosen and remove Q flange retaining nuts (5A). Slide Q flange (5) off of journal flange studs.

STEP 7
Remove the fasteners that secure the rotary joint to the bracket. Remove rotary joint from dryer.

Figure 1
STEP 8
Remove split wedges (55) and the Q flange (5). Sit the Q flange and split wedges aside for reuse.

STEP 9
Place the rotary joint into a hole in a work surface with the nipple (4) passing through the hole first so the rotary joint will rest on the wear plate (16).

STEP 10
During this step, prepare to contain the spring force that is present within the rotary joint. Remove the wedge plate (40) along with the assembly plate (31) by removing two screws (31A). Inspect assembly plate. Replace if worn.

STEP 11
Remove the following: seal ring (6), thrust collar (3), spring (7), nipple (4), nipple body (4A), and seal ring (6). Side the nipple body (4A) off of the nipple (4). Inside the nipple body is an O-ring (4B). Remove and discard it.

STEP 12
Inspect the following items for scoring or excessive wear and replace as required; seal rings (6), spring (7), and wear plate (16). Inspect the nipple (4). The keys must be in good condition and the area where the nipple body’s O-ring seals must be smooth. Discard nipple if these areas are damaged. Inspect the nipple body (4A). The O-ring groove, keyways, and sealing surface must be in good condition. If any area is damaged, replace the nipple body. If the wear plate (16) is damaged, remove wear plate bolts (16A) and separate wear plate from body (1). Clean gasket surfaces and install a new wear plate gasket (8R). Place a new wear plate (16) on body (1) and secure into position with wear plate bolts (16A).

STEP 13
Lubricate a new O-ring (4B) with silicone O-ring lubricant and place it in the nipple body (4A). Place nipple body over the nipple (4) and slide it down engaging the keys in the nipple. Place parts back into the rotary joint body in the following order: seal ring (6) with the flat face against the wear plate, nipple/nipple body assembly against the spherical face of the seal ring (6), Position spring (7) over the nipple. Install thrust collar (3) and seal ring (6) with the spherical face against the thrust collar.

STEP 14
Remove the O-rings (41) from the wedge plate (40). Clean and inspect O-ring grooves for steam cutting. Replace wedge plate if damaged. Lubricate two new O-rings (41) with silicone O-ring lubricant and install into O-ring grooves.

STEP 15
Place a new gasket (8) between the body (1) and the assembly plate (31). Place a new gasket (8) between the wedge plate (40) and the assembly plate (31). Compress the spring with the wedge plate and assembly plate, making sure the keyways in the thrust collar (3) are lined up with the keys on the nipple. Secure wedge plate/assembly plate to the body (1) using socket head cap screws (31A). Tighten cap screws evenly to 10 ft-lbs (14 Nm).

STEP 16
Place a new copper gasket (8Q) into the recess in the journal flange. Make sure the end of the horizontal pipe (99) is smooth and clean where it engages the O-rings (41) in the wedge plate (40). Install the rotary joint assembly back onto the roll by passing it over the horizontal pipe (99), making sure the horizontal pipe passes through the O-rings (41) in the wedge plate (40). Position the rotary joint assembly onto the support bracket. Install bolts that secure the rotary joint to the bracket. Do not tighten at this time. Secure the rotary joint to the roll using the Q flange (5) and split wedges (55). Tighten the Q flange evenly using a star pattern while making sure the gap between it and the journal flange is even. The gap should be approximately 1/8” (3 mm) around the circumference of the flange. The Q flange should not tighten against the journal flange surface. Check rotary joint alignment by making sure the nipple is centered in the wear plate and the body housing.

STEP 17
Set-up the rotary joint by pulling it away from the roll to make sure the keys in the nipple (4) bottom out in the keyway of the nipple body (4A). Move the rotary joint towards the roll 1/8” (3 mm). Tighten the bolts that secure the rotary joint to the bracket. Double check the alignment. Correct alignment if necessary.

STEP 18
Place split rings (42) into the recess in the wedge plate (40). Place pressure plate (43) over the split rings and loosely install screws and lockwashers (44 and 45) that secure pressure plate.

STEP 19
Position syphon as it was in Step 3. Tighten pressure plate screws (45) evenly to 8 ft-lbs (11 Nm). Tap pressure plate with a soft-faced hammer to seat split wedges. Then tighten screws evenly to 16 ft-lbs (22 Nm).

STEP 20
Clean the gasket surface on the head (2). Place a new gasket (8) and position head onto the body (1). Secure into position using head bolts (2A).

STEP 21
Connect steam and condensate hoses. The rotary joint is ready for service.

Dimensions are for reference only and subject to change. Certified drawings are available on request. Please refer to Kadant Johnson Drawing Number A37640 for torque specifications.
