**NOTE:** Please follow your company’s safety procedures whenever working on Kadant Johnson rotary joints and read all of the instructions completely before proceeding.

Please refer to the assembly drawings supplied with your Kadant Johnson rotary joint for part identification. If you have any questions, please contact your Kadant Johnson Representative or Kadant Johnson.

Do not use anti-seize or petroleum-based products on o-rings. Only lubricate the o-rings with the silicone lubricant supplied with the Kadant Johnson repair kit.

**CARBON SEAL REPLACEMENT:**

**STEP 1.**
Close the inlet and outlet valve. Allow the joint to cool sufficiently. Release residual pressure in the system and disconnect the inlet and outlet piping from the joint.

**STEP 2.**
Remove the joint from the roll by unthreading it. If equipped with a horizontal pipe, remove it at this time.

**STEP 3.**
Remove retaining ring (17) using snap-ring pliers.

**STEP 4.**
Pull nipple/bearing sub-assembly from body (1). A press can be used to aid in removal.

**STEP 5.**
Remove the external snap ring (15) from the nipple (4). While pushing down on the seal ring (6B), remove the pins (13). Release the seal ring. Remove and discard the seal ring (6B), o-ring (25), follower (8), and spring (7). Inspect the bearings (3). If they need replacing, follow “Bearing Replacement” instructions on the next page.

**STEP 6.**
Remove from body and discard the counterseat (6A) and o-ring (25). Inspect bushing in elbow (2) if equipped. Replace if worn.

**STEP 7.**
Carefully clean inside of nipple (4) and inside diameter of body (1) where counterseat (6A) and seal ring (6B) sets. Do not scratch the o-ring surface.

**STEP 8.**
Apply a small amount of o-ring lube to both sides of o-ring (25) and fit over end of counterseat (6A). Align flats with pins and gently push into counterbore of body (1), being careful to keep lube away from the flat seal surface of the counterseat.

**STEP 9.**
Place the spring (7) in the bore of the nipple (4).

**STEP 10.**
Place the beveled side (I.D.) of the follower (8) on top of the spring (7).

**STEP 11.**
Apply a small amount of o-ring lube to the o-ring (25) and place in the o-ring groove on the end of the seal ring (6B).
STEP 12.
Insert o-ring end of seal (6B) into the nipple (4) and carefully press down into bore, ensure free movement. While pushing down on the seal ring, align holes in nipple with recess slots in seal ring. Place two pins through the holes provided in the nipple engaging them with the slots in the seal ring. Install external snap ring (15) by placing it around the nipple and through the slots in the pins that retain the seal ring. See Figure 1. Release the seal ring. Use care not to scratch the lapped seal ring face. O-ring lube should be cleaned from the counterseat (6A) and the seal ring (6B) with acetone and a clean cloth.

STEP 13.
Place bearing/nipple assembly into body assembly and carefully slide into place. To fully engage the assembly, a press may be required.

STEP 14.
Hold assemblies together and install retaining ring (17) in groove.

The Kadant Johnson joint is now ready to be placed back in service.

BEARING REPLACEMENT:
Follow steps 1 through 3 of “Carbon Seal Replacement.”

STEP 1B.
After completing Steps 1 through 3, remove retaining ring (9) from nipple (4).

STEP 2B.
Using a press, remove bearings (3) and bearing spacer (11) from nipple. Clean and dry nipple.

STEP 3B.
Using a press fixture that will apply pressure only to the inner-race of the bearing, press a new bearing onto the nipple (4) until it is seated against the shoulder of the nipple.

STEP 4B.
Slide the bearing spacer (11) onto the nipple (4). Using the same press fixture, press the second bearing (3) onto the nipple (4), until it contacts the bearing spacer (11).

NOTE: If the bearings are heated in an oven to 275°F (135°C), they will slide over the nipple (4), and a press will not be required for assembly.

STEP 5B.
Install the retaining ring (9) onto the nipple (4) with flat side toward the bearings.

STEP 6B.
Follow steps 4 through 11 under “Carbon Seal Replacement” to complete repair.
